

- 1) [8 pts] **Gauss' Law.** A solid insulating sphere of radius  $R$  is uniformly charged with total charge  $Q$  and placed at the origin. Use Gauss' law to determine the electric field for a radius  $r < R$  (i.e. inside the sphere) :

solid insulating sphere

- (A)  $E(r) = kQ/r^2$   
 (B)  $E(r) = kQr/R^3$  correct  
 (C)  $E(r) = kQr/2R^3$   
 (D)  $E(r) = kQ/rR$   
 (E)  $E(r) = kQ/2r^2$   
 (F)  $E(r) = kQr^2/R^4$

- 2) [8 pts] **Electric Field.** An electron and a proton are separated by a distance of 5nm (see figure). The electric field at their midpoint is :

- (A) 0  
 (B)  $2.3 \times 10^6$  N/C in the direction of the electron  
 (C)  $2.3 \times 10^6$  N/C in the direction of the proton  
 (D)  $1.15 \times 10^8$  N/C in the direction of the electron  
 (E)  $1.15 \times 10^8$  N/C in the direction of the proton  
 (F)  $4.6 \times 10^8$  N/C in the direction of the electron correct  
 (G)  $4.6 \times 10^8$  N/C in the direction of the proton

- 3) [6 pts] **Electric Potential Energy.** A proton (charge  $e$  and mass  $m$ ) is approaching a stationary mercury nucleus (charge  $80e$ ) head on. When it is far away, the proton's speed is  $v_0$ . What is the distance of closest approach  $d_{\min}$  of the proton to the nucleus ?

- (A) 0  
 (B)  $[k e / (m v_0)]^{1/2}$   
 (C)  $80 k e / (m v_0)$   
 (D)  $2 k e^2 / (m v_0^2)$   
 (E)  $[80 k e^2 / (m v_0^2)]^{1/2}$   
 (F)  $160 k e^2 / (m v_0^2)$  correct

- 4) [8 pts] **Electric Potential.** Four charges of equal magnitude are placed on the corners of a square of sidelength  $a$ . Three of the charges are positive ( $Q_{1,2,3} = Q > 0$ ) and 1 is negative ( $Q_4 = -Q$ ). The total potential energy of this configuration (with the convention  $U(r \rightarrow \infty) = 0$ ) is :

- (A)  $4 kQ^2/a$   
 (B)  $2 kQ^2/a$   
 (C)  $kQ^2/a$   
 (D) 0 correct  
 (E)  $-2 kQ^2/a$   
 (F)  $-4 kQ^2/a^2$

- 5) [6 pts] **Energy in Capacitor.** An air-filled insulated parallel-plate capacitor is held at a fixed charge. If the separation of its plates is doubled, the electric energy stored in the capacitor is :

- (A)  $\frac{1}{4}$  of the original  
 (B)  $\frac{1}{2}$  of the original  
 (C) unchanged  
 (D) doubled correct  
 (E) quadrupled

- 6) [8 pts] **Electric Power.** A light bulb has a power output of 60W. The bulb is connected to a 24 V battery. The current drawn from the battery and the resistance of the light bulb are :

- (A) 0.2 A and  $0.104 \Omega$   
 (B) 0.2 A and  $1.4 \Omega$   
 (C) 0.4 A and  $0.104 \Omega$   
 (D) 0.4 A and  $240 \Omega$   
 (E) 2.5 A and  $0.104 \Omega$   
 (F) 2.5 A and  $9.6 \Omega$  correct

- 7) [6 pts] **Discharging RC Unit.** Consider a simple RC circuit with an initially charged capacitor of capacitance  $C = 1\text{mF}$  and unknown resistance  $R$ . When closing the switch, the current drops to 10% of its initial value within a time of 1.8s. The resistance in this circuit is :

- (A)  $53 \Omega$   
 (B)  $140 \Omega$   
 (C)  $482 \Omega$   
 (D)  $783 \Omega$  correct  
 (E)  $1280 \Omega$   
 (F)  $4145 \Omega$

8) [6 pts] **Lorentz Force.** A laboratory has its four corridors marked with the north, south, east and west directions. It is in a uniform magnetic field that points downward (into the ground); there is no electric field. A negatively charged particle moves north. The Lorentz force on the particle points to :

- (A) North
- (B) South
- (C) East (correct)
- (D) West
- (E) Up
- (F) Down

9) [8 pts] **Magnetic Force from Current.** A long straight wire carries an unknown current  $I$ . A negatively charged particle ( $Q = -2\text{mC}$ ) at  $2\text{ cm}$  from the wire has a velocity of  $50\text{m/s}$  along the direction of the wire (see figure). The particle experiences a force of  $6\ \mu\text{N}$  towards the wire. Determine the magnitude and direction of the current.

- (A) 1.91 A along the electron's velocity
- (B) 1.91 A opposite the electron's velocity
- (C) 6 A along the electron's velocity
- (D) 6 A opposite the electron's velocity correct
- (E) 18.8 A along the electron's velocity
- (F) 18.8 A opposite the electron's velocity

10) [6 pts] **Magnetic Induction.** To determine the strength  $B$  of a uniform magnetic field in his laboratory, an engineer uses a solenoid (a long magnetic coil of radius  $r$  with  $N$  windings), rotating it at an angular frequency  $\omega = 2\pi f$  about an axis perpendicular to the magnetic field and to the symmetry axis along the solenoid. He detects an induced EMF with a maximal value of  $\varepsilon$ . The magnetic field strength is :

- (A)  $B = \varepsilon / N\pi r^2 \omega$  correct
- (B)  $B = \varepsilon \omega / N\pi r^2$
- (C)  $B = \varepsilon \pi r^2 / N\omega$
- (D)  $B = 2\pi r / N\omega \varepsilon$
- (E)  $B = N\varepsilon / 2\pi r \omega$
- (F)  $B = \varepsilon / N2\pi r \omega$

- 11) [8 pts] **RL Unit.** A resistor (resistance  $R$ ) and an inductor (inductance  $L$ ) are connected in series to a battery with EMF  $\mathcal{E}$ , with switch initially at position (a) (see figure). At  $t=0$ , the switch is flipped to position (b) to remove the battery from the circuit (see figure), and the current starts to drop off as  $I(t) = I_0 \exp(-t/\tau)$ . The magnitude of the voltage across the inductor at  $t=0$  and after a long time are :

- (A) 0 and 0  
 (B) 0 and  $\mathcal{E}$   
 (C) 0 and  $RI_0$   
 (D)  $RI_0$  and 0 correct  
 (E)  $RI_0$  and  $RI_0$   
 (F)  $\mathcal{E}$  and  $RI_0$

- 12) [6 pts] **Displacement Current.** An air-filled parallel-plate capacitor is being charged leading to an increase of its electric field from 0 to 12000 V/m over a time interval of 1.5 s. Compute the displacement current through a  $(25 \text{ cm})^2$  area parallel to the plates inside the capacitor.

- (A)  $1.8 \times 10^{-10} \text{ A}$   
 (B)  $4.4 \times 10^{-9} \text{ A}$  correct  
 (C)  $1.7 \times 10^{-9} \text{ A}$   
 (D)  $1.0 \times 10^{-8} \text{ A}$   
 (E)  $0.33 \times 10^{-7} \text{ A}$   
 (F)  $0.33 \times 10^{-5} \text{ A}$

- 13) [8 pts] **EM Plane Wave.** The electric field of a plane wave is described by  $\vec{E} = E_0 \sin(ky - \omega t) \hat{k}$ . The velocity and the magnetic field of this wave are oriented in :

- (A) x- and y-direction  
 (B) x- and z-direction  
 (C) y- and x-direction correct  
 (D) y- and z-direction  
 (E) z- and x-direction  
 (F) z- and y-direction

- 14) [8 pts] **Energy in EM wave.** An electromagnetic wave has a B-field of amplitude  $2 \times 10^{-6} \text{ T}$ . The wave irradiates an area of  $0.5 \text{ m}^2$ . Calculate the intensity of the wave and the time it takes to deposit 1 kJ onto the irradiated area.

- (A)  $1.59 \times 10^{-6} \text{ W/m}^2$  and  $1.3 \times 10^8 \text{ s}$
- (B)  $1.59 \times 10^{-6} \text{ W/m}^2$  and  $25 \text{ s}$
- (C)  $477 \text{ W/m}^2$  and  $4.2 \text{ s}$                       correct
- (D)  $477 \text{ W/m}^2$  and  $1.1 \text{ s}$
- (E)  $1.3 \times 10^5 \text{ W/m}^2$  and  $0.015 \text{ s}$
- (F)  $1.3 \times 10^5 \text{ W/m}^2$  and  $0.12 \text{ s}$
