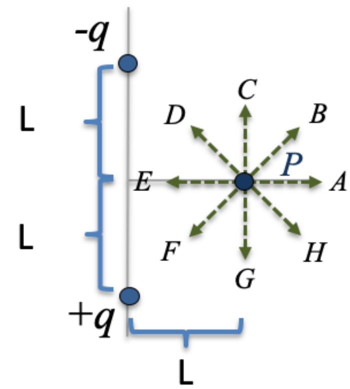
Physics 207 – Exam 1

Sections (207-212, 543-583) – September 23rd, 2021

1) [7 pts] Point P is at 3equal distance from two fixed point charges +q and –q as shown. If a **negative** point charge is placed on P, which dashed arrow on the figure shows the direction of the net electrical **force** felt by the charge at P due to the fixed charges?



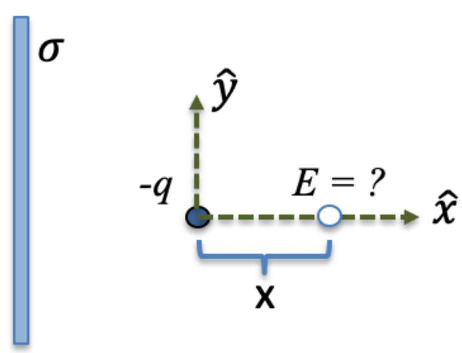
A. A
B. B
C. C
D. D
E. E
F. F
G. G
H. H

2) [8 pts] In the previous problem, if the charge at point P is -q, the magnitude of the force felt by that charge is :

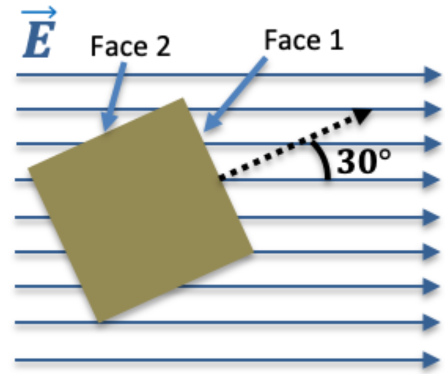
A. $\frac{2kq^2\, L}{(2L^2)^{3/2}}$
B. $\frac{kq^2\, L}{(2L^2)^{3/2}}$
C. $\frac{2kq^2\, L}{(L^2)^{3/2}}$
D. $\frac{2kq^2\, L^2}{(2L^2)^3}$
E. $\frac{kq^2\, L}{(2L^2)^3}$
F. $\frac{2kq^2\, L}{(L^2)^3}$

3) [8 pts] A negative point charge –q is at the coordinate origin, at some distance from an infinitely long plate with uniform charge σ per unit area as shown in the picture. The electric field a distance *x* from the point charge as shown in the figure is:

A. $\left(\frac{\sigma}{2\varepsilon_0} - k\frac{q}{x^2}\right)\,\hat{x}$
B. $\left(\frac{\sigma}{2\varepsilon_0} + k\frac{q}{x^2}\right)\,\hat{x}$
C. $\left(-\frac{\sigma}{2\varepsilon_0} - k\frac{q}{x^2}\right)\,\hat{x}$
D. $\left(-\frac{\sigma}{2\varepsilon_0} + k\frac{q}{x^2}\right)\,\hat{x}$
E. $\left(\frac{\sigma}{2\varepsilon_0} - k\frac{q}{x}\right)\,\hat{x}$
F. $\left(\frac{\sigma}{2\varepsilon_0} + k\frac{q}{x}\right)\,\hat{x}$
G. $\left(-\frac{\sigma}{2\varepsilon_0} - k\frac{q}{x}\right)\,\hat{x}$
H. $\left(-\frac{\sigma}{2\varepsilon_0} + k\frac{q}{x}\right)\,\hat{x}$

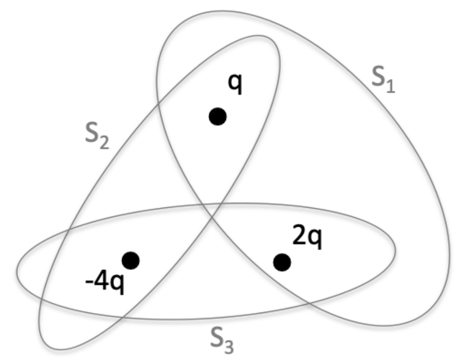


4) [8 pts] a cube of side L is tilted 30 degrees with respect to a homogenous external electric field of magnitude E. The flux through the faces 1 and 2 indicated in the picture are (face 1, face 2):



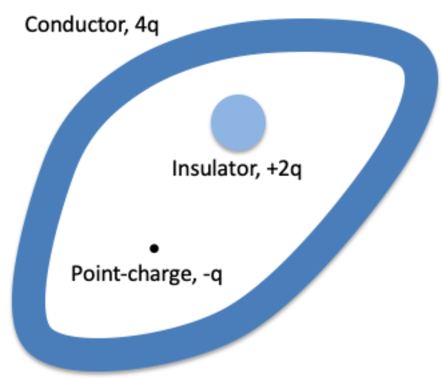
A. $EL^2\cos(30), -EL^2\sin(30)$
B. $EL^2\cos(30), -EL^2\cos(30)$
C. $EL^2\sin(30), -EL^2\sin(30)$
D. $EL^2\sin(30), -EL^2\cos(30)$
E. $-EL^2\cos(30), \; EL^2\sin(30)$
F. $-EL^2\cos(30), \; EL^2\cos(30)$
G. $-EL^2\sin(30), \; EL^2\sin(30)$
H. $-EL^2\sin(30), \; EL^2\cos(30)$

5) [7 pts] Three Gaussian surfaces S_1, S_2, S_3 are enclosing charges as shown. The flux enclosed by each corresponding surface can be ordered from the most positive to the most negative as:



A. $\Phi_1 > \Phi_2 > \Phi_3$
B. $\Phi_1 > \Phi_3 > \Phi_2$
C. $\Phi_2 > \Phi_3 > \Phi_1$
D. $\Phi_2 > \Phi_1 > \Phi_3$
E. $\Phi_3 > \Phi_1 > \Phi_2$
F. $\Phi_3 > \Phi_2 > \Phi_1$

6) [7 pts] A closed hollow conductor with net charge 4q encloses inside a point-like charge -q, and an insulator with charge 2q as shown in the figure. Find the total charge distributed in the **outer surface** of the conductor:



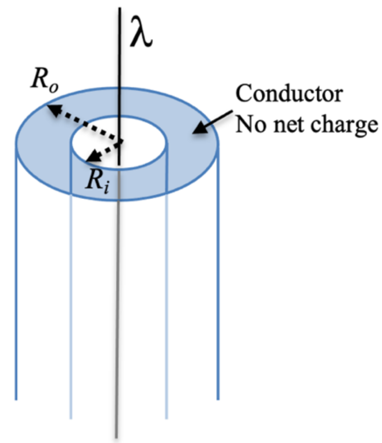
A. -2q
B. -1q
C. 0q
D. 1 q
E. 2 q
F. 3 q
G. 4 q
H. 5 q

7) [8 pts] Two thin concentric spherical shells have radii R_1 and R_2 with $R_1 < R_2$. A total charge of -2Q is uniformly spread in the inner shell and a total charge of Q is spread on the outer shell. The electric field in the region between the two shells, at R1 < r < R2, is

A. pointing outward with magnitude $k\,Q/r^2$
B. pointing inward with magnitude $k\,Q/r^2$
C. pointing outward with magnitude $k\,2Q/r^2$
D. pointing inward with magnitude $k\,2Q/r^2$
E. pointing outward with magnitude $k\,Q/r$
F. pointing inward with magnitude $k\,Q/r$
G. pointing outward with magnitude $k\,2Q/r$
H. pointing inward with magnitude $k\,2Q/r$

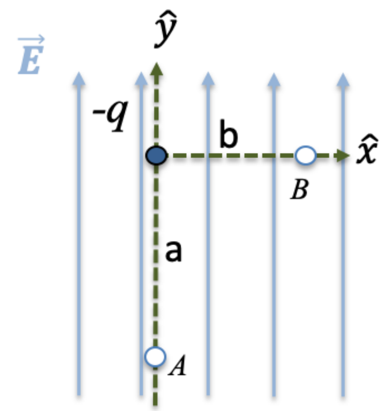
8) [8 pts] A long string with charge density per unit length λ, is at the center of long hollow cylindrical conductor with no net charge, internal radius of R_i and external radius R_o as shown in the figure. The charge per unit area σ induced **in the inner surface** of the conductor is:

A. $\sigma = \frac{+\lambda}{2\pi R_i}$
B. $\sigma = \frac{-\lambda}{2\pi R_i}$
C. $\sigma = \frac{+\lambda}{\pi R_i}$
D. $\sigma = \frac{-\lambda}{\pi R_i}$
E. $\sigma = \frac{+\lambda}{2\pi R_i^2}$
F. $\sigma = \frac{-\lambda}{2\pi R_i^2}$
G. $\sigma = \frac{+\lambda}{\pi R_i^2}$
H. $\sigma = \frac{-\lambda}{\pi (R_0^2 - R_i^2)}$



9) [8 pts] In a region of space there is a constant electric field of magnitude E_0 in the Y direction, superimposed with the electric field of a point charge -q at the origin. Compute the difference in electric potential at points B and A, V_B-V_A, as located in the figure.

A. $+E_0 a + kq\frac{(a-b)}{ab}$
B. $+E_0 a - kq\frac{(a-b)}{ab}$
C. $-E_0 a + kq\frac{(a-b)}{ab}$
D. $-E_0 a - kq\frac{(a-b)}{ab}$
E. $+E_0 b + kq\frac{(a-b)}{ab}$
F. $+E_0 b - kq\frac{(a-b)}{ab}$
G. $-E_0 b + kq\frac{(a+b)}{ab}$
H. $-E_0 b - kq\frac{(a+b)}{ab}$

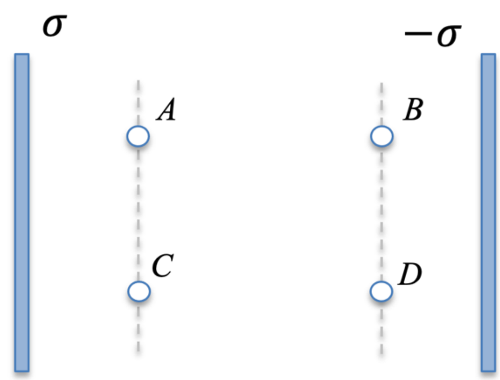


10) [8 pts] At locations A and B, the electric potential has the values V_A=20 V and V_B= - 10 V. A small particle with charge q = -2 μC is released from rest at one of the locations and passes through the other location with kinetic energy K. Which of the following statement is true?

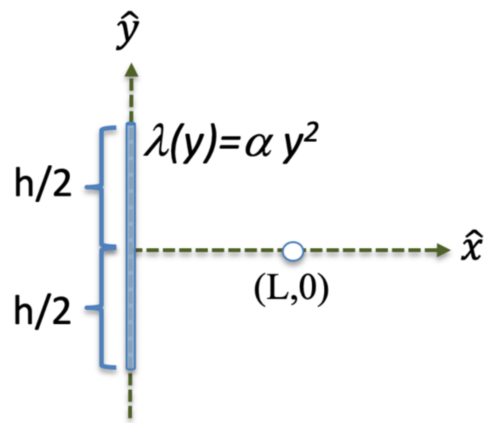
A. The other location is A with K= 20 μ J
B. The other location is A with K= 40 μ J
C. The other location is A with K= 60 μ J
D. The other location is A with K= 80 μ J
E. The other location is B with K= 20 μ J
F. The other location is B with K= 40 μ J
G. The other location is B with K= 60 μ J
H. The other location is B with K= 80 μ J

11) [7 pts] Two equal but opposite charged plates with uniformly distributed charges are as shown. Which of the following statement is **incorrect** ? [6 pts]

A. Position A is at a higher potential than position B
B. Position A is at a higher potential than position D
C. Position C is at a higher potential than position A
D. Position C is at a higher potential than position B
E. Position C is at a higher potential than position D



12) [8 pts] A short line of length **h** is centered at the origin, aligned with the y-axis and has a non-uniform linear charge density $\lambda(y) = \alpha y^2$, where α is a known constant. The electric field produced by the charged line at the point (L,0) is given by :



A. $E_x(L,0) = \int_{-h/2}^{h/2} \frac{k\alpha y^2 L\, dy}{(L^2+y^2)^{3/2}}$

B. $E_x(L,0) = \int_{-h/2}^{h/2} \frac{k\alpha y^3\, dy}{(L^2+y^2)^{3/2}}$

C. $E_x(L,0) = \int_{-h/2}^{h/2} \frac{k\alpha y^2\, dy}{(L^2+y^2)}$

D. $E_x(L,0) = \int_{-h/2}^{h/2} \frac{k\alpha y^2 L\, dy}{(L^2+y^2)^3}$

E. $E_x(L,0) = \int_{-h/2}^{h/2} \frac{k\alpha y^3 L^2\, dy}{(L^2+y^2)^3}$

F. $E_x(L,0) = \int_{-h/2}^{h/2} \frac{k\alpha L^2\, dy}{(L^2+y^2)^3}$

13) [8 pts] A charge of value **3q** is fixed at the origin, and a charge **-q** is fixed at position (0,b). A third charge of value **q** is then moved from infinity to position (a,0) as shown in the figure. Assuming the potential of the third charge at infinity is zero, the work done **by the electric force** as the third charge is moved from infinity to its final position (a,0) is:

A. $+k\frac{3q^2}{a} + k\frac{q^2}{b}$

B. $-k\frac{3q^2}{a} + k\frac{q^2}{b}$

C. $+k\frac{3q^2}{a} - k\frac{q^2}{b}$

D. $-k\frac{3q^2}{a} - k\frac{q^2}{b}$

E. $+k\frac{3q^2}{a} + k\frac{q^2}{\sqrt[2]{a^2+b^2}}$

F. $-k\frac{3q^2}{a} + k\frac{q^2}{\sqrt[2]{a^2+b^2}}$

G. $+k\frac{3q^2}{a} - k\frac{q^2}{\sqrt[2]{a^2+b^2}}$

H. $-k\frac{3q^2}{a} - k\frac{q^2}{\sqrt[2]{a^2+b^2}}$
